ComicViewer 2000 ReadMe

Intro

   Welcome to The comicViewer 2000: an application created by Landon Dare at the request of Zappos for the iOS Application Development College Intern position. It sources web comics over the Internet from http://xkcd.com, and displays them in a simple and interactive native environment. The application follows the basic functionality outlined in the design description with a few extra bells and whistles that make the design more intuitive. I have tried to make a program that I would actually prefer to use over the website, and I have worked to keep the interface clean like xkcd website itself. Please feel free to contact me if anything in the code, application, or documentation is unclear.

Thanks,
Landon Dare

Third party code and resources

   The application utilizes the AFNetworking library freely available on its github page (https://github.com/AFNetworking/AFNetworking).

   The images displayed in the application are sourced from the xkcd website and freely accessible through their open APIs. This application also makes use of several freely available images collected from numerous sources on the Internet.
